- A. EAP
- B. 802.1x
- C. RADIUS
- D. WPA2

**Answer:** A

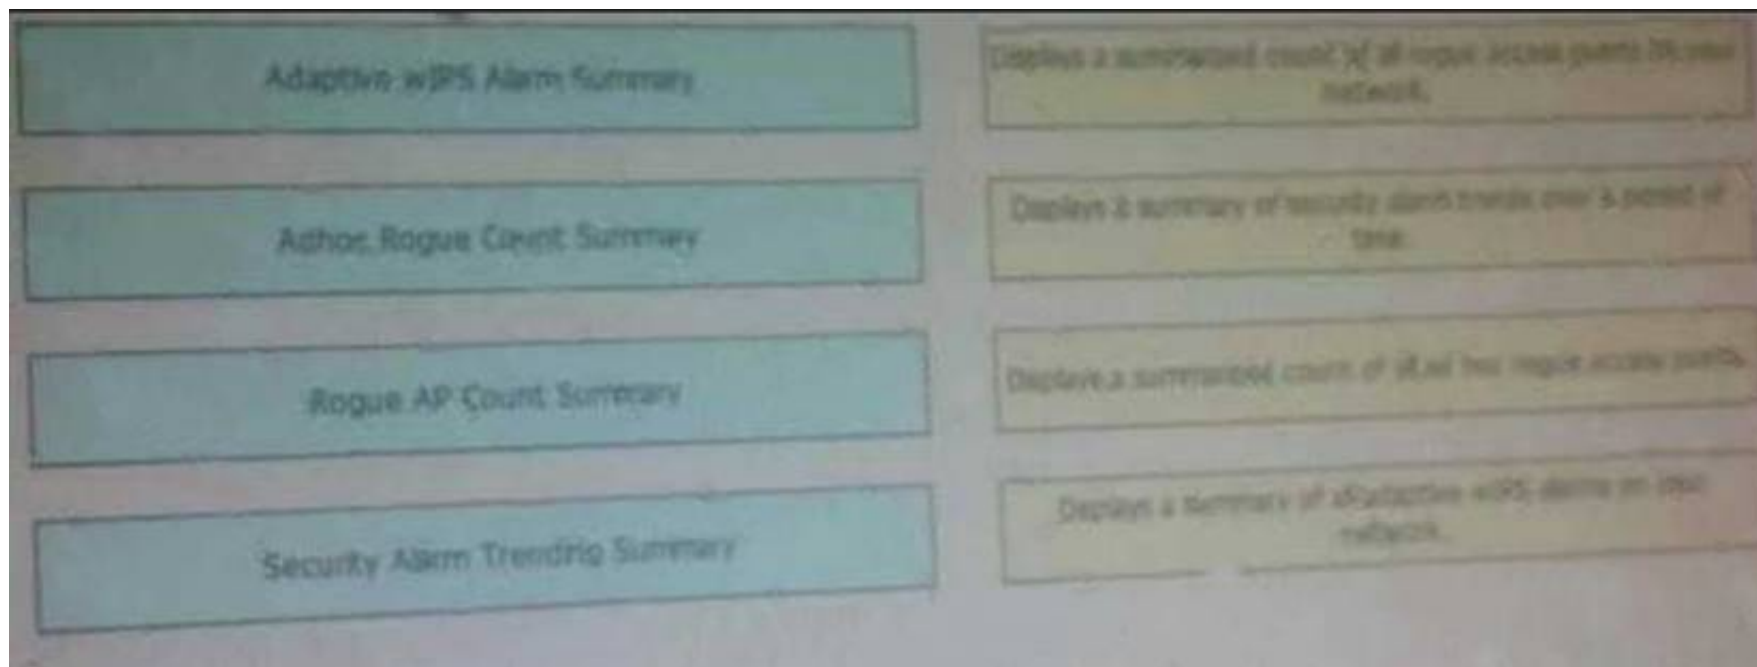

**Explanation:**

Define the Layer 2 Authentication as WPA2 so that the clients perform EAP-based authentication (PEAP-MS-CHAP v2 in this example) and use the advanced encryption standard (AES) as the encryption mechanism. Leave all other values at their defaults. <https://www.cisco.com/c/en/us/support/docs/wireless/5500-series-wireless-controllers/115988-nps-wlc-config-000.html>

WPA2 Enterprise with 802.1x is being used for clients to authenticate to a wireless network through an ISE server. For security reasons, the network engineer wants to ensure only PEAP authentication can be used. The engineer sent instructions to clients on how to configure their supplicants, but users are still in the ISE logs authenticating using EAP-FAST. Which option describes the most efficient way the engineer can ensure these users cannot access the network unless the correct authentication mechanism is configured?

- A. Enable AAA override on the SSID, gather the usernames of these users, and disable their RADIUS accounts until they make sure they correctly configured their devices.
- B. Enable AAA override on the SSID and configure an access policy in ACS that denies access to the list of MACs that have used EAP-FAST.
- C. Enable AAA override on the SSID and configure an access policy in ACS that allows access only when the EAP authentication method is PEAP.
- D. Enable AAA override on the SSID and configure an access policy in ACS that puts clients that authenticated using EAP-FAST into a quarantine VLAN.

**NEW QUESTION 167**

An engineer is designing a high availability wireless network. What mechanism should be the focus for high availability?

- A. SNR
- B. channel reuse
- C. RSSI
- D. cell overlap

**NEW QUESTION 170**

Refer to the exhibit. The security team has configured an IBN profile on ISE for the guest wireless network to provide captive portal service. Where must the network engineer configure the ACL and portal for the Cisco AireOS controller?

- A. GuestPreLogin downloadable ACL on ISE, login portal on ISE
- B. GuestPreLogin local ACL on WLC, login portal on WLC
- C. GuestPreLogin downloadable ACL on ISE, login portal on WLC
- D. GuestPreLogin local ACL on WLC, login portal on ISE

**Answer:** C

**Explanation:**

The flow would be the following:

- User associate to the Web Auth SSID
- User starts its browser
- The WLC Redirect to the guest portal (ISE/NGS)
- The user authenticate on the portal
- The Guest Portal redirect back to the WLC with the credentials entered
- The WLC Authenticate the guest user via Radius
- The WLC Redirects back to the original URL.

**NEW QUESTION 172**

An engineer is configuring EAP-TLS with a client trusting server model and has configured a public root certification authority. Which action does this allow?

- A. specifies a second certification authority to trust
- B. utilizes two subcertification authority servers
- C. creates a PKI infrastructure
- D. validates the AAA server

**Answer:** D

**Explanation:**

To support EAP-TLS, the AAA server (for example, Cisco Secure ACS) must have a certificate. Either a public certification authority or a private certification authority can be used to issue the AAA server certificate. The AAA server will trust a client certificate that was issued from the same root certification authority that issued its certificate.

**NEW QUESTION 174**

An engineer is configuring an autonomous AP for RADIUS authentication. What two pieces of information must be known to configure the AP? (Choose two.)

- A. shared secret
- B. username and password
- C. RADIUS IP address
- D. group name
- E. PAC encryption key

**Answer:** AC

**Explanation:**

You identify RADIUS security servers by their host name or IP address, host name and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

**NEW QUESTION 179**

When implementing secure PCI wireless networks, which two are specific recommendations in the PCI DSS? (Choose two)

- A. Use a minimum 12-character random passphrase with WPA
- B. Segment logging events with other networking devices within the organization.
- C. Use VLAN based segmentation with MAC filters.
- D. Change default settings.
- E. Implement strong wireless authentication

**Answer:** DE

**Explanation:**

Wireless networks that are part of the CDE must comply with all PCI DSS requirements. This includes using a firewall (requirement 1.2.3) and making sure that additional rogue wireless devices have not been added to the CDE (requirement 11.1). In addition, PCI DSS compliance for systems that include WLANs as a part of the CDE requires extra attention to WLAN specific technologies and processes such as:

- A. Physical security of wireless devices, B. Changing default passwords and settings on wireless devices, C. Logging of wireless access and intrusion prevention,

D. Strong wireless authentication and encryption, E. Use of strong cryptography and security protocols, and F. Development and enforcement of wireless usage policies. This section will cover each of these requirements sequentially.
